

# Ruby Script App

A simple app that assists actors and performers with memorising a script. The program will welcome the user, and prompt them to select the option that reflects what the user would like to work on. The user can import a script of their choosing, or search for a script to work on. The program will then ask which character the user wants to play, and will then run the lines with the user.

## Features

Feature: Interactive script reader

Implementation: count the words in the script that the user types (their characters lines) so that the program knows to print the next line. It would know when to print the words until the #{character1} name appears next

Feature: Script search

Implementation: Data will be fetched from a Kaggle site and indexed by the script name. It will fuzzy match.

Feature: Script import

Implementation: Use file.read.split so that user can import the script they're learning into the program
